EXECUTIVE SUMMARY

Our latest research highlights a significant breakthrough in food preservation within the AgriTech and FoodTech sectors. A novel approach utilizing pre-slaughter nutritional supplementation has been developed to combat meat oxidation and discoloration. This innovation promises to enhance the quality and shelf-life of premium meat products, addressing critical challenges in food waste and consumer appeal. We anticipate this research will pave the way for new specialized feed additives and precision nutrition protocols within the livestock industry.

#1

Vitamin E supplementation moderates salt-induced oxidation status in beef.

23/50

Main Researcher: Oren Tirosh

[AgriTech] [FoodTech]

"New feed additive protects premium salted beef from discoloration, extending shelf-life and market appeal."

WHY NOW

The global demand for high-quality, long-lasting meat products is growing, while food waste remains a significant concern. This innovation offers a direct solution for producers to differentiate their products and reduce spoilage, tapping into the premium segment of the meat market.

COMMERCIAL ANGLE

Development of specialized livestock feed additives or precision nutrition protocols to extend the shelf-life and visual appeal of premium salted beef products.
