EXECUTIVE SUMMARY

Hebrew University researchers are advancing cutting-edge artificial intelligence for precision medicine. A standout project involves a novel, second-generation AI system, built on the 'constrained-disorder principle,' currently undergoing a clinical trial for Parkinson's disease. This AI holds significant promise for personalized disease management and could evolve into a therapeutic intervention, addressing a critical need in neurodegenerative care.

#1

A feasibility open-label clinical trial utilizing second-generation artificial intelligence based on the constrained-disorder principle in patients with Parkinson's disease.

Main Researcher: Ilan Y

[Software/AI] [Neuroscience] [Clinical] [Medical Device]

"Novel AI system targets personalized Parkinson's disease management and potential therapeutic intervention."

WHY NOW

The global market for Parkinson's solutions has urgent needs for personalized management. This AI, already in clinical trials, offers a near-term opportunity for integration with existing devices and precision therapeutics.

COMMERCIAL ANGLE

Commercialization could focus on licensing the AI algorithms for personalized Parkinson's disease management, potentially integrating with existing wearable sensors or developing a companion diagnostic to identify suitable patients.
